

Abstract

The present invention consists of a disposable sanitary panty containing a thickened crotch pad which in one preferred embodiment has a comfortable bikini type fit which is high up on the legs and rear of the panty. It may be further provided with miniature hook and loop tabs at one or both sides of the device so that the wearer can easily put it on or take it off. It may also be provided with elastic gussets along the sides of the device for comfort and superior fit for the wearer. Further, a pocket may be provided in either the front panel and/or the rear panel of the device so that a gel pack which has been heretofore heated or cooled may be inserted within this pocket. Additionally, in yet an additional preferred embodiment of the present invention, the rear panel may be of a thong cut, for either additional comfort to the wearer, or to eliminate panty lines when slacks or shorts are worn. The disposable sanitary panty may be made from a paper fabric, plastic or nylon fabric, a knit type fabric, or it may be constructed from several layers, with the exterior and interior layer being made from cotton for comfort and to alleviate the possibility of skin allergies.
